Ziira

Ziira Intelligence

The layer that checks a business every day and tells owners what needs attention, on any system.

SIMPLIFY. CONNECT. GROW.

Version 1.0 · October 2026

Confidential

OVERVIEW

What Ziira Intelligence is

Ziira Intelligence is the analysis and alerting layer of Ziira. It connects to a business's systems, checks the data every day, and delivers findings and recommended actions to owners and managers on WhatsApp and in the Command Center.

What it does

Function	Description
Detect	Finds losses, errors and risks: money not received, stock not accounted for, unusual entries, late payers, cost increases, missed deadlines.
Explain	States the cause, linking areas of the business, and shows the records behind every finding.
Recommend and act	Lists options ranked by importance, and sends follow-ups, reminders and approval requests within permissions the business sets.

Deployment

Mode	Description
Inside Ziira Core	Built into the ERP and its Command Center. Live access to all 12 modules; can prepare actions in Core for approval.
Standalone	Runs on top of existing systems: Odoo, Zoho, QuickBooks, ERPNext, SAP Business One, POS systems, M-Pesa and bank statements. The business keeps its current system. This is the market entry point; businesses can later move to Ziira Core.

What it adds to an existing ERP

Left to people in an ERP	Handled by Ziira Intelligence
Reports must be opened to find problems	Problems are found daily and sent to the right person
Each module reports separately	Areas are analysed together to identify causes
M-Pesa, bank and other POS sit outside the ERP	Brought in and matched against ERP records
Entries are accepted as entered	Unusual or high-risk entries are flagged
Used at a desk by trained staff	Used on WhatsApp by owners and managers

Target customers

Businesses where staff handle money or stock without direct owner supervision, and where losses cost more than the subscription: multi-branch retailers, distributors, absent-owner outlets, and high-volume cash businesses.

01 · DATA ACCESS

Can Ziira read the data?

Yes, for most systems. The data belongs to the business, and most modern systems let the business give an approved app read access. Some add conditions or costs.

System	Access	What to know
Ziira Core	Full	Built in, live, no limits.
Zoho	Yes	The business approves Ziira with one click. Daily limits depend on its Zoho plan.
ERPNext	Yes	API key; no extra cost.
Odoo	Depends on plan	Self-hosted Odoo: yes. Odoo's hosted service: only on the Custom plan; otherwise daily exports.
QuickBooks Online	Yes, fees at scale	The business approves Ziira. Intuit charges apps for reading data above a free monthly allowance.
SAP Business One	Via partner	Usually set up by the business's SAP partner.
Sage, older POS	Exports	Older versions often have no usable API; scheduled report exports work instead.
M-Pesa	Yes, with limits	Live payment notices through Safaricom's API if the number's notification link is free; history from M-Pesa statements.
Banks	Varies	Some banks offer APIs; otherwise statements by email or upload.

Access terms change by version and plan, so each business is checked before onboarding.

How Ziira gets in

1. Ziira is registered

Once, as an approved app with each vendor: Odoo, Zoho, Intuit, Safaricom and others.

2. The business approves

The owner clicks "Allow" or creates an access key. No passwords are shared.

3. Ziira reads

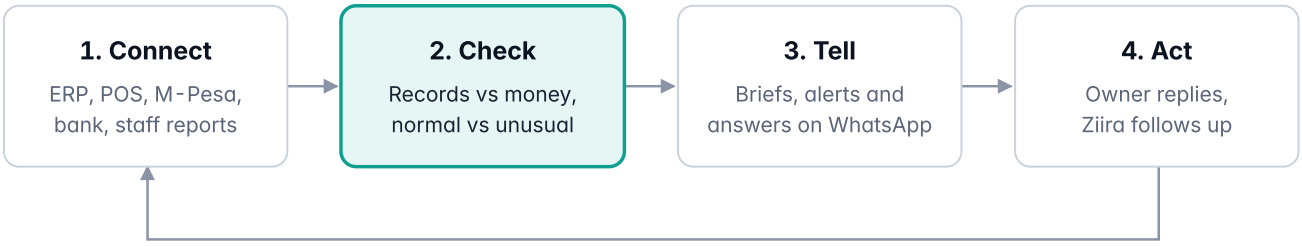

Only what was allowed, read-only by default. Access can be withdrawn at any time.

Where official access is not available, Ziira uses scheduled report exports, forwarded M-Pesa and bank statements, or closing reports staff send to the Ziira WhatsApp number. These work for any business, including one with no system, with daily rather than live data.

02 · HOW IT WORKS

How it works

Ziira runs a four-step cycle every day.

Repeated every day, learning what is normal for the business

1. **Connect:** collect the latest data from every connected source.
2. **Check:** compare *records* (what staff entered: sales, stock moves, expenses, closing reports) with *evidence* (what is hard to change: M-Pesa, bank, supplier invoices, stock counts), and compare today with what is normal.
3. **Tell:** send a short message, most important items first, with the records behind each finding.
4. **Act:** on the owner's reply, Ziira asks staff to explain, sends reminders, or prepares approvals.

> **Numbers come from the records, not AI guesses.** Totals and gaps are calculated directly from the data. AI explains, ranks and answers questions in English or Swahili.

Example findings

Finding	Evidence	Recommended action
Branch sales exceed money received by 4,400	Two cash sales with no matching cash or M-Pesa receipt	Ask the cashier to explain
Product margin fell from 9% to 4%	Supplier cost up 6%; selling price unchanged	Update the selling price
Cash shortfall of 600,000 in two weeks	Payroll and a supplier payment due together; two customers 45 days late	Chase the customers; ask the supplier to split payment
Credit order from an overdue customer	Balance of 680,000, 45 days late	Pause credit or require part payment

Values are illustrative.

03 · COVERAGE

What Ziira checks

Coverage depends on the data connected. On Ziira Core or a full ERP, it covers every area of the business and links them together.

Area	Examples of what Ziira flags
Cash and sales	Sales without matching M-Pesa, cash or bank; sales falling by branch, product or staff
Customers and credit	Late payers; customers paying slower; credit given to overdue customers
Suppliers and purchasing	Price rises not passed on; orders above usual price; goods paid but not received
Stock	Stock missing without a sale; stockouts; slow or expiring stock
Cash planning	Weeks when payments due exceed expected cash
Books	Unusual journal entries; margin changes and their causes; unreconciled accounts
People and payroll	Overtime trends; new names, pay or bank changes before payroll approval
Projects and assets	Work not invoiced; jobs over budget; vehicle costs rising (where the data exists)
Tax	Invoices missing from eTIMS; VAT, PAYE and statutory deadlines

Control checks

An ERP accepts any valid entry. Ziira checks the entries themselves, every day:

- Manual stock adjustments
- Price and discount overrides
- Voided sales, refunds and credit notes
- Back-dated or late entries
- Changes at unusual times
- One person creating and approving
- Changed supplier bank details
- Possible duplicate bills or payments

The most valuable findings combine areas, such as a cash shortfall explained by payroll timing, a supplier payment and late customer payments.

> **Flags are questions, not accusations.** Most have a good explanation. Ziira shows the evidence and records each answer, which protects honest staff as well as the business.

Who receives what, and what they can do

In a small business the owner may be the only user. In a larger one, each role receives what is relevant, within permissions the owner sets.

Role	Receives
Owner or director	Daily or weekly brief across the business, urgent alerts, answers to any question
Finance manager	Cash forecast, reconciliation gaps, receivables, payables, control flags, tax deadlines
Branch manager	Their branch only: sales against money, stock issues, staff flags
Accountant or auditor	Reconciled figures and open flags with explanations, with the owner's permission

Four levels of action

Level	What Ziira does	Example
1 · Read only	Reports findings; changes nothing	Daily brief and alerts
2 · Follow up	Sends messages on the owner's instruction	Asks a manager to explain a gap
3 · Prepare	Creates drafts for a person to approve	Draft purchase order or price update
4 · Act within limits	Carries out agreed routine actions	Reminders to customers over 30 days late

Every business starts at Level 1, and moving up is its choice. Nothing involving money, prices or customers changes without approval unless the owner has set a rule. Every action is recorded, and Ziira never moves money.

What changes by system

	M-Pesa, POS, staff reports	Other ERPs	Ziira Core
Coverage	Cash, sales, basic stock	Most areas the ERP holds	All 12 modules
Freshness	Daily	Depends on connection	Live
Control checks	Limited	Depends on what the API exposes	Full, including change history
Actions	Levels 1–2	Levels 1–4 where the API allows	Levels 1–4

Trust, limits and rollout

How Ziira protects trust

- **Read-only by default,** through a dedicated key the business can withdraw.
- **Role-based visibility:** a branch manager does not see payroll.
- **Evidence with every finding,** linked to the records behind it.
- **Data protection:** compliance with Kenya's Data Protection Act, with clear consent and clarity on where data is stored and which AI services process it.

Limits

- It cannot see what is never recorded anywhere.
- It shows gaps; it does not prove wrongdoing.
- Some alerts will be wrong, especially in the first weeks, until it learns the business.
- On other systems, what it can read and do depends on their access terms.
- It does not replace an accountant, auditor or tax adviser.

Onboarding

When	What happens
Day 1	Connect the system, M-Pesa and bank; confirm the system, version and plan
Days 2–5	Map branches, staff, accounts and payment methods; read past months so Ziira learns what is normal
Week 2	First briefs, plus a one-off review of past records showing what Ziira would have caught
Weeks 3–4	Adjust alerts with the owner; add managers who should receive briefs

Validation

Before full launch, Ziira runs a 30-day pilot with 5 to 6 businesses, some on an ERP and some without. Success criteria: most pilot businesses pay to continue, and Ziira identifies problems they were not aware of.
